Abstract:

The **Adaptive Interview Preparation Assistant** is an AI-powered web application designed to help students and job seekers prepare for technical and HR interviews through personalized learning. The system analyzes the user's skill level and generates adaptive interview questions based on their performance, providing instant feedback, model answers, and improvement suggestions. It includes features such as topic-wise practice, difficulty adjustment, progress tracking, and performance analysis to enhance interview readiness. Built using Python, Flask, HTML, CSS, JavaScript, and SQLite, the application offers an interactive and user-friendly platform that enables users to strengthen their knowledge, improve confidence, and prepare effectively for real-world placement interviews. The system also provides a structured learning experience by identifying weak areas and recommending focused practice sessions. Its adaptive approach ensures that users receive questions matching their current proficiency level, making interview preparation more efficient and engaging. Overall, the project aims to improve problem-solving skills, communication abilities, and overall interview performance through continuous assessment and personalized guidance.
